## HOW TO REPLY TO THIS NOTICE:

I. Review the SMALL ENTITY status shown above.

If the SMALL ENTITY is shown as YES, verify your current SMALL ENTITY status:

A. If the status is the same, pay the TOTAL FEE(S) DUE shown above.

B. If the status above is to be removed, check box 5b on Part B - Fee(s) Transmittal and pay the PUBLICATION FEE (if required) and twice the amount of the ISSUE FEE shown above, or

If the SMALL ENTITY is shown as NO:

A. Pay TOTAL FEE(S) DUE shown above, or

B. If applicant claimed SMALL ENTITY status before, or is now claiming SMALL ENTITY status, check box 5a on Part B - Fee(s) Transmittal and pay the PUBLICATION FEE (if required) and 1/2 the ISSUE FEE shown above.

II. PART B - FEE(S) TRANSMITTAL, or its equivalent, must be completed and returned to the United States Patent and Trademark Office (USPTO) with your ISSUE FEE and PUBLICATION FEE (if required). If you are charging the fee(s) to your deposit account, section "4b" of Part B - Fee(s) Transmittal should be completed and an extra copy of the form should be submitted. If an equivalent of Part B is filed, a request to reapply a previously paid issue fee must be clearly made, and delays in processing may occur due to the difficulty in recognizing the paper as an equivalent of Part B.

### EXAMINER'S AMENDMENT

Examiner has amended claim 1 to correct two obvious and minor typographical errors. It is clear both from context, and from Examiner's previous discussions with Applicant concerning the amendment filed 8/27/2009, that Applicant intends claim 1 to read as amended below.

The application has been amended as follows, with additions underlined, deletions bracketed or struck through, and all changes in boldface:

---

1. (Currently Amended) An image forming apparatus operable in a first image formation mode for forming an image on an image bearing member by using developer under a first predetermined image forming condition and a second image formation mode for forming an image on an image bearing member by using developer under a second image forming condition which is different from the first predetermined image forming condition and is set so that an amount of consumption of developer with respect to an identical image in the second image formation mode is smaller than that in the first image formation mode, the apparatus comprising:

a storing device configured to store threshold information on an amount of usage of the image bearing member;

a controller configured to set said ~~the~~ image forming apparatus in the first image formation mode or the second image formation mode; and

an image processing controller configured to discriminate a size of a concentrated pixel area in image information when the second image formation mode is

set, and to perform first and second image density lowering processes on image information representing pixel areas of different sizes, depending on the discriminated size of the pixel area,

wherein in a state in which said controller is configured to set said image forming apparatus in the second image formation mode, an image density lowering process performed on the image information by said image processing controller is changed depending on the discrimination result of said image processing controller in such a manner that the first image density lowering process is performed so that image information representing pixels in pixel areas of a first size of the image to be formed is a first image density, and the second image density lowering process is performed so that image information representing pixels in pixel areas of a second size of the image to be formed is a second image density lower than the first image density; and

wherein said controller sets the second image forming condition on the basis of the discrimination result of said image processing controller and the threshold information stored in said storing device when the amount of usage of the image bearing member reaches a predetermined threshold represented by the threshold information.

---

## **DETAILED ACTION**

### ***Election/Restrictions***

This application is in condition for allowance except for the presence of claims 11-31 directed to embodiments 2-4 non-elected without traverse. Accordingly, claims 11-31 have been cancelled.

### ***Allowable Subject Matter***

Claims 1 and 3-10 are allowed.

The following is an examiner's statement of reasons for allowance:

The prior art does not disclose or suggest, "wherein in a state in which said controller is configured to set said image forming apparatus in the second image formation mode ....the first image density lowering process is performed so that image information representing pixels in pixel areas of a first size of the image to be formed is a first image density, and the second image density lowering process is performed so that image information representing pixels in pixel areas of a second size of the image to be formed is a second image density lower than the first image density; and wherein said controller sets the second image forming condition on the basis of....the threshold information stored in said storing device when the amount of usage of the image bearing member reaches a predetermined threshold represented by the threshold information," in combination with the remaining claim elements as set forth in claim 1, and claims 3-10 depending therefrom.

Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably

accompany the issue fee. Such submissions should be clearly labeled "Comments on Statement of Reasons for Allowance."

### ***Response to Arguments***

Regarding Applicant's remarks filed 8/27/2009, Examiner agrees that amended claim 1, and claims 3-10 depending therefrom, are now allowable over the prior art.

### ***Conclusion***

The prior art made of record and not relied upon is considered pertinent to applicant's disclosure.

Seto et al. (5,581,358), Ernst et al. (6,975,428), Miyamoto (7,062,190), Ogushi et al. (JP pub 2000-333008), Otsu et al. (5,835,233), Ishimura (6,791,714), and Davidson et al. (6,266,153) are all cited for disclosing inventions wherein the relative densities of the edge and interior of printed images are varied to maintain image quality, sometimes in a toner-saving mode. However, none of these references disclose a controller setting the these edge and interior densities on the basis of stored predetermined threshold information corresponding to an amount of usage of the image bearing member when the amount of usage of the image bearing member reaches such a predetermined threshold.
